Intro Into Software

Tuesday 9/2

Debrief

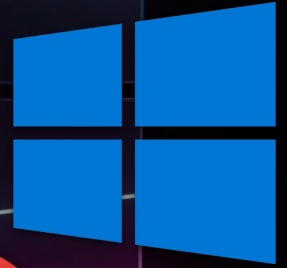

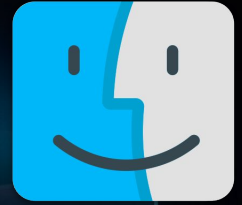

Main goal of this meeting:

- **Introduce basic computer software**
- **Discuss our next meeting**
- **Answer questions and receive feedback**

Operating Systems

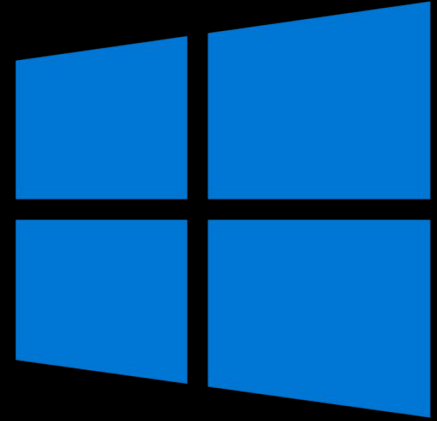

- **3 main competitors**
 - **Windows**
 - **Linux**
 - **Chrome OS**
 - **Mac OS**
- **Windows is simpler, home and organization oriented**
- **Linux is very complex, and generally used in server / enterprise applications**
- **Chrome OS is education and focus oriented**
- **Mac OS is productivity oriented, and generally used in media production**

Windows

- Simple yet expandable, but expensive
- Somewhat lightweight, lots of bloatware
- Go to for many businesses and corporations for compatibility and reliability
- Pre installed on many pre built desktops, great choice for gaming and productivity

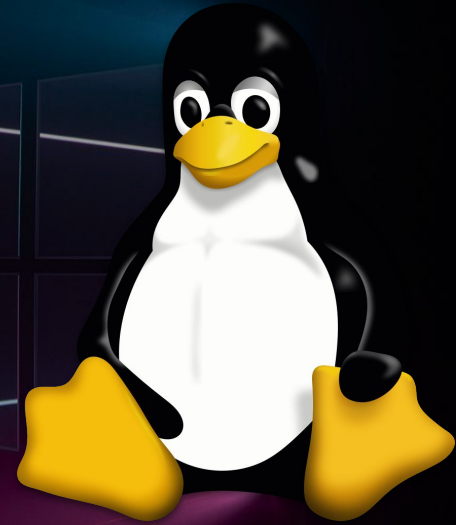

- Apple hardware & software proprietary
- Comes pre-installed on apple hardware, cannot be installed elsewhere
- Made for business and corporation use in mind
- Widely seen in desk jobs that require high security and focus on the tasks given to workers

- Straightforward and extremely simple
- Based off of Linux with heavy modifications
- Designed for educational environments with minimal expandability
- Lightweight but generally underperforms in simple tasks
- Good choice for students or people who don't need an overpowered machine for simple browsing

- Very complicated, generally terminal based
- Hundreds of different 'distros' to choose from
- Descendant of Unix, an older Linux-like OS
- User-based, free and open source
- Extremely fast, lightweight and is #1 for enterprise applications
- Good choice to learn about cyberspace

Executables (Windows)

- Windows specific, not supported elsewhere natively
- “Packages” that contain commands (batch) or files that extract to install or run a program
- .EXE (executables) and .MSI (Microsoft installer) are the most common, with .JAR packages being used for the Java programming language
- Very common within windows for installing or running anything from games to applications

File Types

- Most common and wide seen files are zip, text, image, and video/sound files.
 - Zip files compress files into a folder that can later be decompressed
 - Text files hold text, pretty simple to understand
 - Image files, .jpg/.png, hold images that can be displayed on the computer and other supported devices and they can be varying resolution.
 - Video/Audio files, .mp4/3 hold videos or audio that can be played on the computer or other supported devices

.zip/.rar

.jpg/.png

.mp4/3

Our Current Mission

Digital Bathroom Pass

Finalization:

All that is needed now is a bit of debugging and we should be ready for deployment

Feel free to speak to an officer if you have any ideas or recommendations!

Next Meeting

Tuesday 8/26

Ground plan:

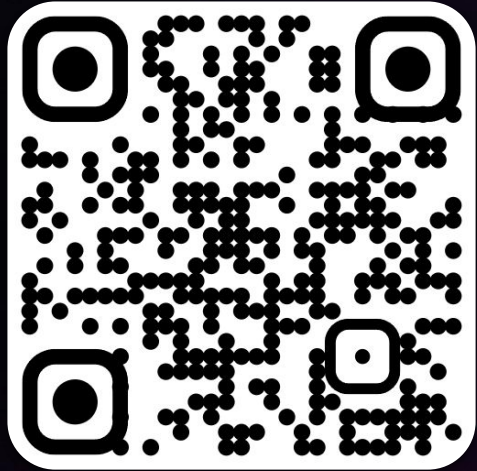

- Dive deeper into the niche side of computer software
- Discuss the next mission if available
