

Operating Systems (OS)

Software Meeting #1

Presented by the vice pres!

An operating system is the high-level abstraction of the interface used to communicate between the user and the kernel.

**What is a
operating
system?**

Overview of common operating systems

Windows

- Most common consumer system
- rarely for servers

Linux

- Highly flexible OS for almost all uses
- Used in most servers

MacOS

- Proprietary operating system for apple computers

Chrome OS

- this is what your school computer uses

The Kernel

The Kernel is basically the core of the operating system, with it being the middleman between software and hardware(aka our computer).

How to choose the best operating system for your personal goals?

Windows

- Simpler
- Excellent for multiple types of stuff like games and software compatibility
- A lot of apps/software can only work on windows
- Just great for general use overall
- But has bloatware, and is power hungry

Linux

- Very light and not so power hungry
- Free and open source
- Very popular and handy for servers
- Good choice for programming, or wanting to learn about computers
- But can be hard to understand at first and may have issues itself

>>>>

Fun facts about operating system

Android actually uses linux

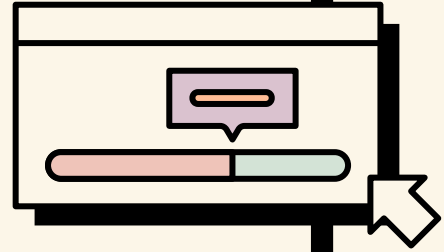

Linux has multiple of different types of distros like ubuntu, debian, etc, etc

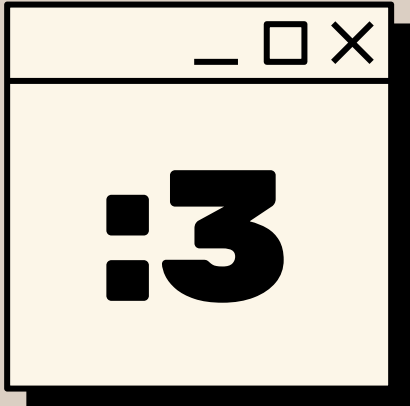

Linux actually runs a huge part in internet's infrastructure

The first version of windows was released in 1985

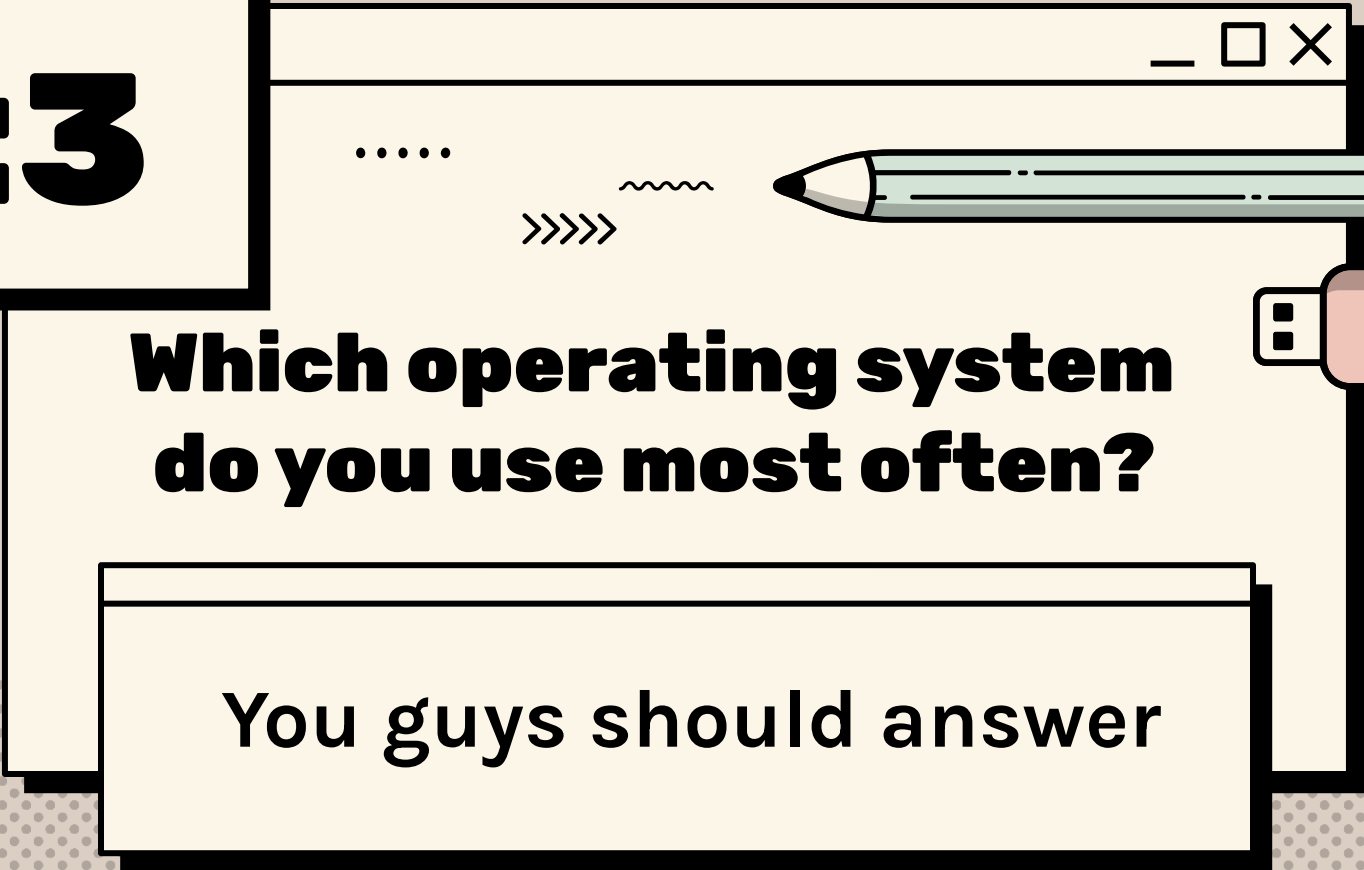

You are actually able to run multiple OS with the use of dual booting or virtual machines
